Visual Studio Shell is Microsoft's environment for developing, designing, running, debugging and administering .NET applications. This package is comprised of installation files for the IDE and a collection of runtime files and components that are required for the Visual Studio Shell to run. Features: Visual Studio Shell Redistributable package includes the following components: Visual Studio IDE - the IDE must be preinstalled on the target computer for applications to run properly. The Runtime version depends on the mode of operation of the Visual Studio Shell, either integrated or isolated. By default, the Visual Studio Shell Redistributable package installs the Runtime 4 package. However, there is a checkbox within the package options that allows you to select the Runtime 4.5 package. In addition, the .NET Framework 4.5 package includes the System.ServiceModel.Syndication 4.0.0.0 file. This component is required for Web Application Projects, which is the default type of project under the isolated mode of Visual Studio Shell. The Visual Studio Shell Redistributable Package is intended to allow developers to deploy their applications based on the Visual Studio Shell. It contains the required runtime binaries and other components that are mandatory in the distribution process. The redistributable package is compatible with any version of Visual Studio, as Microsoft is offering installation files for Visual Studio 2008, 2010,. The package comes in two different versions, one dedicated to the integrated mode and the other to the isolated mode, depending on the developer's choice.
